

FEEDBACKS

1st point: UI design	<p>The panel doesn't like the navigation drawer (2 clicks to go to a new fragment): suggests instead a design inspired by the Blablacar application with a Bottom navigation bar which is more adapted for a simple application like ours and allows to switch fragments in a single click and a swipe functionality to swipe between tabs)</p> <p>Robustness to screen size changes and text length</p> <p>Dark mode to be implemented</p>
2nd point: Third-Party messaging app	<p>Would like to have the choice between email address and phone number to communicate either by SMS or email</p> <p>Use of a third-party messaging app such as WhatsApp</p> <p>The ideal would be to implement our own chat</p> <p>Suggests having one notification a day to be reminded to pick up a product</p>
3rd point: Product/User information	<p>Concerning user and product information: direct access to the quantity/expiration date and name of the product</p> <p>Distinction to be made between the DLC (date limite de consommation) and the DLM (or DLUO) (date limite d'utilisation optimale)</p> <p>Only share the room number of the supplier after an order has been made (lack of privacy)</p>
Remarks/Suggestions The user uses the application autonomously, discovering every provided functionality	<ul style="list-style-type: none"> - Given and Collected fragments do not need to be associated in a Tab layout. - Possibility to see the product he just posted on his product news feed - Provide a additional "History" tab to remind our history (what product we've shared and when, what products need to be retrieved ...)
Questions Questions left unanswered after the interview	<ul style="list-style-type: none"> - Be notified whenever a product is available? - What about the supplier side? When does it need to be notified? - Fields in the edit profile controller should be set to text and not hint so that the user understands that they can modify all or part of the form.
